

House Prices in America

Updated for the 2nd Quarter of 2008

**A Global Insight/National City Corporation
Joint Venture**

September 2008

Summary

- House price declines are slowing. During the second quarter of 2008, for example, the decline slowed to a 5.3 percent annualized rate from a 6.6 percent rate during the first quarter. Prices are now down 4.8 percent from one-year ago, this cycle's peak in house prices.
- House price declines are less pervasive. Price declines affecting 152 of 330 metro areas. These 152 metro areas account for 46 percent of all single-family housing units in America. California, Michigan and Florida continue to account for the most severe losses; these three states contain 43 of the 50 worst performing metro areas.
- Extreme overvaluation is essentially nonexistent. Only six metro areas are judged to be overvalued during the second quarter of 2008, down from a peak of 51 metro areas in 2005. The decline of overvaluation is even greater when measured as a share of total housing units and real estate value. As of Q2, metro areas amounting to only 1 percent of the U.S. single-family housing stock were deemed to be extremely overvalued. In terms of total real estate value, areas amounting to 2 percent were deemed to be overvalued. These figures are down from 31 percent and 16 percent, respectively, two years ago. In short, the "bubble" is gone and house prices reflect a healthy balance in relation to long-term fundamentals.

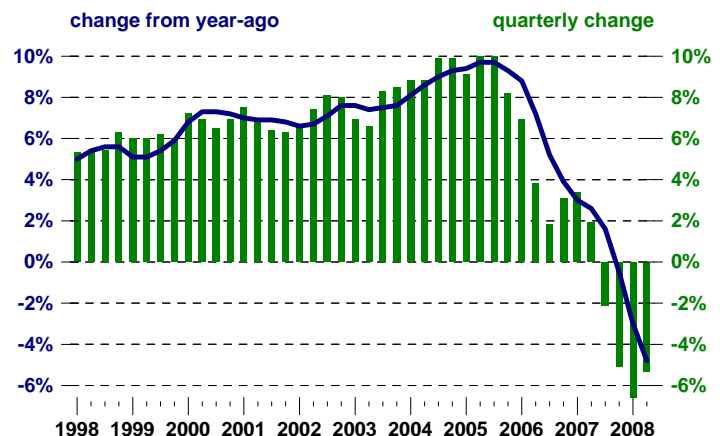

Recent Evidence on House Prices

House prices continued to decline during the second quarter of 2008, falling at a 5.3 percent annualized pace, according to the latest Office of Federal Housing Enterprise Oversight (OFHEO) release which serves as the raw material for our price estimates. This marks the fourth consecutive decline and leaves prices 4.8 percent below the year-ago peak.

Nonetheless, both the pace and breadth of price declines have diminished. The second quarter decline, for example, compares with a more severe, 6.6 percent pace during the first quarter. In terms of breadth, the second quarter witnessed 152 metro area price declines out of the 330 areas studied, or 46 percent of the total. This is down from 267 (81 percent) during the first quarter and 295 (89 percent) during the fourth quarter of last year.

That house price declines are slowing is not unique to the OFHEO dataset. In fact, it is found in all major house price metrics, including those from the National Association of Realtors (median existing house prices), the Commerce Department (median new house prices) and the Top-20 metropolitan area index from Standard and Poors. Further, this assertion still holds when the data are seasonally adjusted, which implies that the slowing is not due to spring-time sales

strength. (The OFHEO data, though not seasonally adjusted, does not exhibit statistically significant seasonal variation.)

Price performance still varies dramatically across the country, however. California, Florida and Michigan, continue to show the most serious price declines, accounting for 43 of the 50 biggest price declines during the latest period. Other areas in the "Bottom-50" include Las Vegas, Phoenix and Washington DC — all identified by our research two years ago as most vulnerable to price decline.

House Price Appreciation: Second Quarter, 2008 (Seasonally Adjusted Annual Rate)

House Price Valuations

Our approach to determining statistically normal house values¹ considers not only house prices and interest rates, but household incomes, population densities and any historical premiums or discounts metropolitan areas have exhibited over time. We examined these factors for 330 metro areas now accounting for 78 percent of all existing housing units in America and 91 percent of all related real estate value, to determine what house prices *should* be, in this statistical sense.

Based on an historical examination of 142 actual metro area price corrections during the 1985-2008 period (see Appendix C), we consider valuations in excess of +35 percent as “extremely overvalued” and present a risk of substantial price decline (10 percent, or greater) going forward. Valuations between ± 15 percent are consistent with one standard deviation of the historically normal distribution, and considered

“fairly valued,” accordingly. Between extremely overvalued and fairly valued are areas above the historically normal range, but not so high as to be at risk of substantial price decline. We call these areas “overvalued.” Finally, any area below the historically normal range, below -15 percent, is considered “undervalued.”

According to our latest analysis, the incidence of extreme overvaluation has declined sharply. Only six markets surpassed that threshold during the second quarter, almost identical to the 5 identified during the first quarter. Overvaluation was most pervasive during the fourth quarter of 2005, at which time 51 metro areas were considered at risk.

The markets that are now overvalued are mainly located in the Northwestern portion of the United States (Washington, Oregon, and Utah). These areas have seen prices begin to decline only during the last year; and two areas, Honolulu, HI and Wenatchee, WA, have yet to see any price declines. Areas that had been extremely overvalued in late 2005 began to see prices decline toward the end of 2006 and early in 2007. These areas are now the ones with some of the

¹ See *House Prices in America: Methodology Update* at www.nationalcity.com/housevaluation.

House Prices in America: 2nd Quarter 2008 Update

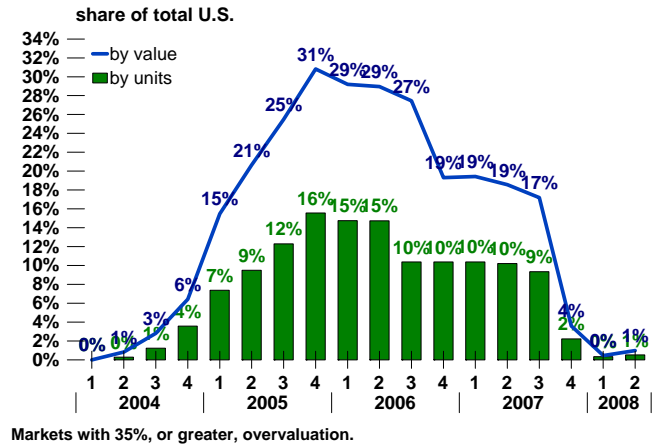

largest price declines and the largest changes in their valuation levels.

Pockets of overvaluation continue to remain on the coastal edges of the country, while the middle section remains either fairly valued or undervalued. These areas did not see the extreme fluctuations in price that the coastal areas saw, and therefore valuations have remained fairly consistent in these markets.

Another way of measuring the degree of overvaluation is by the share of the total housing market meeting the criterion of overvalued. For example, at its peak in the fourth quarter of 2005, 16 percent of all housing units in America were in metro areas classified as overvalued. By the second quarter of 2008, however, that figure dropped to a modest 1 percent. When looked at in market value terms, overvaluation peaked at 31 percent during the fourth quarter of 2005. However, that measure has also fallen dramatically, to just 1 percent during the first quarter of 2008. In short, the U.S. housing market valuations are “normal” in the statistical sense.

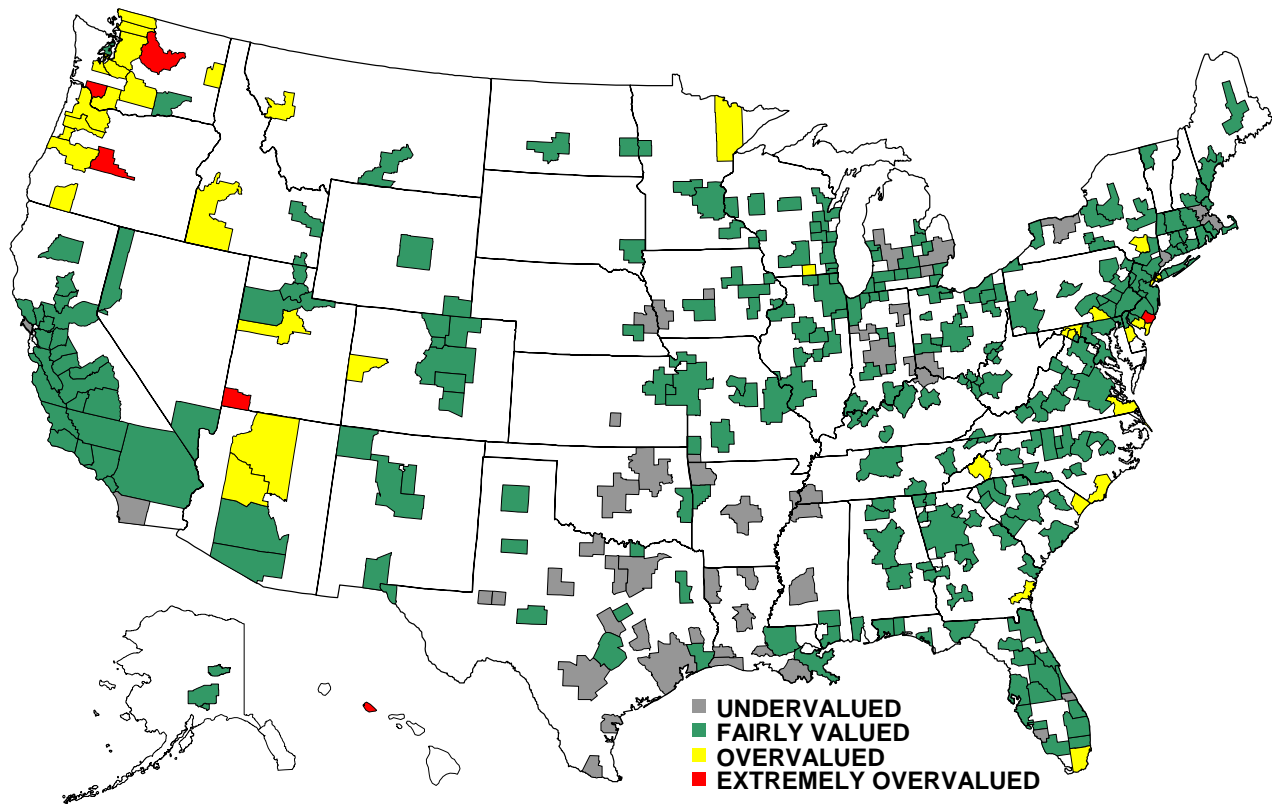

Some markets are overvalued whilst others are undervalued, with no meaningful imbalance overall. This, of course, is a dramatically different situation than we found 2 years ago.

Over-Valued Housing Markets

Markets with 35%, or greater, overvaluation.

House Price Valuation: Second Quarter, 2008

*For a variety of reasons, these metrics will change slightly with periodic updates to the analysis. For an explanation, see *House Prices in America: Methodology Update*, on www.nationalcity.com/housevaluation.

NOTES:

Price corrections are defined as declines of at least 10 percent over a period of at least 8 quarters.

Ranked by starting date are 142 price corrections observed over the past 23-year period.

The median, or typical, price correction is 17 percent (excluding those underway).

The median, or typical, degree of overvaluation prior to a correction is 35 percent.

The median, or typical, duration of a correction is 18 quarters (excluding those underway).

The more severe the overvaluation, the greater the subsequent declines tended to be: correlation = +0.20.

The more severe the overvaluation, the shorter the duration tended to be: correlation = -0.28.

* These price declines have not necessarily completed.

AVERAGE	20%	14	35%
